About our app, the public todo list & API

Our term project app is essentially a public todo list that anyone is able to use. On the front end, users are able to insert data within two types of tables; the school table, and the personal table. To insert data, the user will have to type their name and the item they want to add to the global list. This data that is accumulated is then out for the public to access as an API. For example, if a developer needs to use test information in relation to a todo list, they can use our API to fill a potential user's mock data as they test the early stages of an application or personal project. They also have the freedom to add, delete and update to the list via the API links so that it is more flexible when used in one's own project.
